Hiring Team

OKX

Re: Infrastructure Stability Architect

Dear Hiring Team,

I am applying for the Infrastructure Stability Architect role in OKX Engineering / Infrastructure. The role calls for a deep understanding of how DevOps and SRE systems are built, the ability to rationalise architecture for new business lines, and the ability to stand up a complete system from zero. My 12+ years of experience map onto each of these, and as a Singapore Permanent Resident I have a current right to work in Singapore.

At Shanghai Droi Tech I modelled the CI/CD of a Backend-as-a-Service platform by integrating Jenkins, Docker and Kubernetes, codified infrastructure with Terraform and Ansible, and made Git the single source of truth for environment state so every change landed through review rather than manual steps. I also built an end-to-end test framework with syntax checks, API detection and request profiling. At TSMC I carried the same principle onto a Kubernetes platform running Istio, EFK, Prometheus, Grafana and Redis: Argo CD reconciled cluster state from Git and Terraform described the underlying cloud and cluster resources, keeping environments reproducible and reviewable, and I set a project standard of test coverage above 90%.

At ByteDance (TikTok) I owned the wallet data architecture roadmap. I designed transaction data redundancy across data centres, lowering implementation and maintenance effort by two job grades, and consolidated the one-off cross-data-centre channels left by a deadline-driven phase into a single transport. The EU data migration I delivered was then generalised into a high-abstraction process adopted by business lines outside wallet, the kind of architecture rationalisation I would bring to new business lines at OKX.

I work in both Java (four and a half years with Spring Boot) and Golang, and I would welcome the chance to discuss how I can strengthen the stability of OKX's infrastructure.

Sincerely,

Shuk Liu
